The challenge: VPNs grant too much trust

Broad perimeter access means a single compromised credential unlocks the whole network. Identity- and context-based least-privilege access to private resources, with continuous posture checks, and a better experience than VPN.

**Least privilege,
continuously verified**

0

trust assumed by default

5

operating systems
supported

100%

of sessions posture-
checked

1. Single risk-based policy

- Control access by identity, device posture, geography, application risk and compliance context.

● Identity- and context-based access

● Application-risk policy

● Compliance-aware decisions

2. Continuous device posture

- Check OS, antivirus, encryption, firewall and location at connection and throughout the session.

● Posture checks mid-session

● BYOD via browser extension

● Continuous enforcement

3. Clientless application access

- Publish private apps through a browser portal for users and third parties, no client required.

● Clientless access

● Windows, macOS, iOS, Android, Linux

● Private-backbone performance

One access policy. Every user, everywhere.

Identity- and context-based least-privilege access to private resources, with continuous posture checks, and a better experience than VPN.

Capability area	Includes
Single risk-based policy Control access by identity, device posture, geography, application risk and compliance context.	Identity- and context-based access
	Application-risk policy
	Compliance-aware decisions
Continuous device posture Check OS, antivirus, encryption, firewall and location at connection and throughout the session.	Posture checks mid-session
	BYOD via browser extension
	Continuous enforcement
Clientless application access Publish private apps through a browser portal for users and third parties, no client required.	Clientless access
	Windows, macOS, iOS, Android, Linux
	Private-backbone performance

THE CHALLENGE

Broad perimeter access

- ✓ VPN puts users on the network, not on the specific app they need.

Untrusted devices

- ✓ Posture is checked once at login, then never again.

Poor remote experience

- ✓ Backhauling through a VPN hub adds latency and frustration.

Part of one platform

Universal Zero Trust Network Access runs alongside the rest of the SecureTrust Cyber platform, with one console and one policy engine.

Firewall-as-a-Service

Intrusion Prevention System

DNS Security

Secure Web Gateway

Cloud Access Security Broker

Data Loss Prevention

AI Security for End Users

SIEM Platform

Managed Patch Management

Common questions

Does ZTNA replace my VPN?

Yes. It replaces broad perimeter access with granular, per-resource policies and a better remote experience.

Can unmanaged devices connect?

Yes. BYOD and unmanaged devices get granular zero-trust access through a browser extension or clientless portal.

What happens if a device fails a posture check?

Access is terminated or restricted automatically until the device is remediated.
