

SECURETRUST CYBER

DNS Security

Secure the protocol attackers hide in

Inspect DNS requests in real time, block malicious destinations before connection, and detect phishing, tunneling and crypto-mining hidden in DNS traffic.

— The challenge: DNS is a blind spot

Attackers exploit DNS because it is rarely inspected, hiding phishing, tunneling and data exfiltration in plain sight.

Malicious domains

Requests to C&C and phishing sites go through before any session is blocked.

DNS tunneling

Data exfiltration hides inside legitimate-looking DNS queries.

Crypto-mining

Mining traffic degrades endpoints and inflates costs, unseen.

Block before connection

- Phishing-toolkit detection
- Credential-harvesting prevention
- Threat-agnostic analysis
- Centralized DNS events
- Domain reputation analysis
- Exfiltration detection
- Anomaly-based blocking
- Crypto-mining prevention

Part of one platform. DNS Security runs alongside Firewall-as-a-Service, Intrusion Prevention System, Secure Web Gateway, Universal Zero Trust Network Access, Cloud Access Security Broker, Data Loss Prevention, AI Security for End Users, SIEM Platform and Managed Patch Management, with one console and one policy engine.

— Key capabilities

Every DNS request is inspected and scored in real time, so malicious destinations are stopped before a session begins.

AI-based phishing protection

Analyze webpage components, domain age, popularity and phishing-toolkit patterns to stop credential harvesting.

Phishing-toolkit detection

Domain reputation analysis

Credential-harvesting prevention

DNS tunneling detection

Inspect packet size, record type and subdomain ratios to identify anomalous exfiltration.

Exfiltration detection

Threat-agnostic analysis

Anomaly-based blocking

Unified event visibility

Log every DNS threat event in one searchable data lake and dashboard.

Centralized DNS events

Crypto-mining prevention

Investigation and reporting

— Common questions

What can DNS Security detect?

Phishing, impersonation, DNS tunneling, crypto-mining and malicious domains, including threats hiding in permitted DNS traffic.

Does it slow down lookups?

No. Inspection happens in real time in the cloud without adding latency.
