

SECURETRUST CYBER

Intrusion Prevention System (IPS)

Stop attacks in real time

Cloud-delivered intrusion prevention that inspects internet, WAN and cloud traffic, including TLS, and blocks malicious activity inline.

— The challenge: Signatures alone miss modern attacks

Evolving threats evade signature-based defenses and hide inside encrypted traffic.

Evasive threats

Domain squatting, DGAs and brand impersonation slip past static signatures.

Encrypted traffic

TLS hides attacks from appliances that cannot inspect it.

Emerging CVEs

Exploits land before systems can be patched.

Detection beyond signatures

- Domain squatting and DGA detection
- Behavioral analysis
- C&C domain blocking
- Emerging-CVE mitigation
- Brand impersonation
- Malicious download blocking
- Lateral-movement detection
- 250+ threat intelligence feeds

Part of one platform. Intrusion Prevention System runs alongside Firewall-as-a-Service, DNS Security, Secure Web Gateway, Universal Zero Trust Network Access, Cloud Access Security Broker, Data Loss Prevention, AI Security for End Users, SIEM Platform and Managed Patch Management, with one console and one policy engine.

— Key capabilities

AI/ML models, heuristics and 250+ threat feeds find known and emerging attacks.

AI/ML threat detection

Real-time models detect domain squatting, DGAs, brand impersonation and other evasive threats.

Domain squatting and DGA detection

Brand impersonation

Behavioral analysis

Ransomware kill-chain defense

Block malicious downloads and command-and-control, and detect lateral movement across the WAN.

Malicious download blocking

C&C domain blocking

Lateral-movement detection

Virtual patching

Deploy mitigations for high-risk emerging CVEs while impacted systems are patched.

Emerging-CVE mitigation

250+ threat intelligence feeds

Global geo-fencing

— By the numbers

250+

threat intelligence feeds

TLS

traffic inspected inline

24/7

adaptive protection

— Common questions

How does it go beyond signatures?

AI/ML models, purpose-built heuristics and aggregated threat intelligence detect evasive and emerging attacks.

Can it protect systems while they are being patched?

Yes. Virtual patching deploys mitigations for high-risk CVEs before systems are updated.

Does it work for remote users and cloud?

Yes. It inspects branch, cloud and remote-user traffic without appliance sizing limits.

Talk to an Expert

See how Intrusion Prevention System fits your environment in a 30-minute conversation with a security expert.
