

SECURETRUST CYBER

Universal Zero Trust Network Access

One access policy. Every user, everywhere.

Identity- and context-based least-privilege access to private resources, with continuous posture checks, and a better experience than VPN.

— The challenge: VPNs grant too much trust

Broad perimeter access means a single compromised credential unlocks the whole network.

Broad perimeter access

VPN puts users on the network, not on the specific app they need.

Untrusted devices

Posture is checked once at login, then never again.

Poor remote experience

Backhauling through a VPN hub adds latency and frustration.

Least privilege, continuously verified

- Identity- and context-based access
- Compliance-aware decisions
- BYOD via browser extension
- Clientless access
- Application-risk policy
- Posture checks mid-session
- Continuous enforcement
- Windows, macOS, iOS, Android, Linux

Part of one platform. Universal Zero Trust Network Access runs alongside Firewall-as-a-Service, Intrusion Prevention System, DNS Security, Secure Web Gateway, Cloud Access Security Broker, Data Loss Prevention, AI Security for End Users, SIEM Platform and Managed Patch Management, with one console and one policy engine.

— Key capabilities

Grant only the access each user needs, and re-verify posture for every session.

Single risk-based policy

Control access by identity, device posture, geography, application risk and compliance context.

Identity- and context-based access

Application-risk policy

Compliance-aware decisions

Continuous device posture

Check OS, antivirus, encryption, firewall and location at connection and throughout the session.

Posture checks mid-session

BYOD via browser extension

Continuous enforcement

Clientless application access

Publish private apps through a browser portal for users and third parties, no client required.

Clientless access

Windows, macOS, iOS, Android, Linux

Private-backbone performance

— By the numbers

0

trust assumed by default

5

operating systems supported

100%

of sessions posture-checked

— Common questions

Does ZTNA replace my VPN?

Yes. It replaces broad perimeter access with granular, per-resource policies and a better remote experience.

Can unmanaged devices connect?

Yes. BYOD and unmanaged devices get granular zero-trust access through a browser extension or clientless portal.

What happens if a device fails a posture check?

Access is terminated or restricted automatically until the device is remediated.
